RELIABILITY TECHNIQUES

BY SANJAY AND ARVIND SESHAN

LESSON OBJECTIVES

- Learn how to make your robot more reliable
- Learn about common problems you might face
- Learn some possible solutions

WHY DISCUSS RELIABILITY?

- While working on the Challenges lesson, you might have experienced frustration because the robot did not behave the same way or move as expected.
- These types of frustrations are common in competitions such as FIRST LEGO League as well.
- This lesson introduces the reliability issues faced by FIRST LEGO League teams. Many concepts are applicable to non-competition situations, but the terminology in the lesson and the main focus is for competition robots.

Visit FLLTutorials.com for a series of lessons on being more reliable in FIRST LEGO League.

SOURCES OF PROBLEMS

Problem	Impact
Starting alignment varies from launch to launch	Each launch is different and missions sometimes do not work.
Robots do not travel straight for long or turn exactly the same amount	It is hard to predict the robot location exactly.
Errors accumulate as you travel	Long missions tend to fail. It is hard to do missions far from Launch/Home
Battery levels impact motor performance	Tweaks that work today fail tomorrow

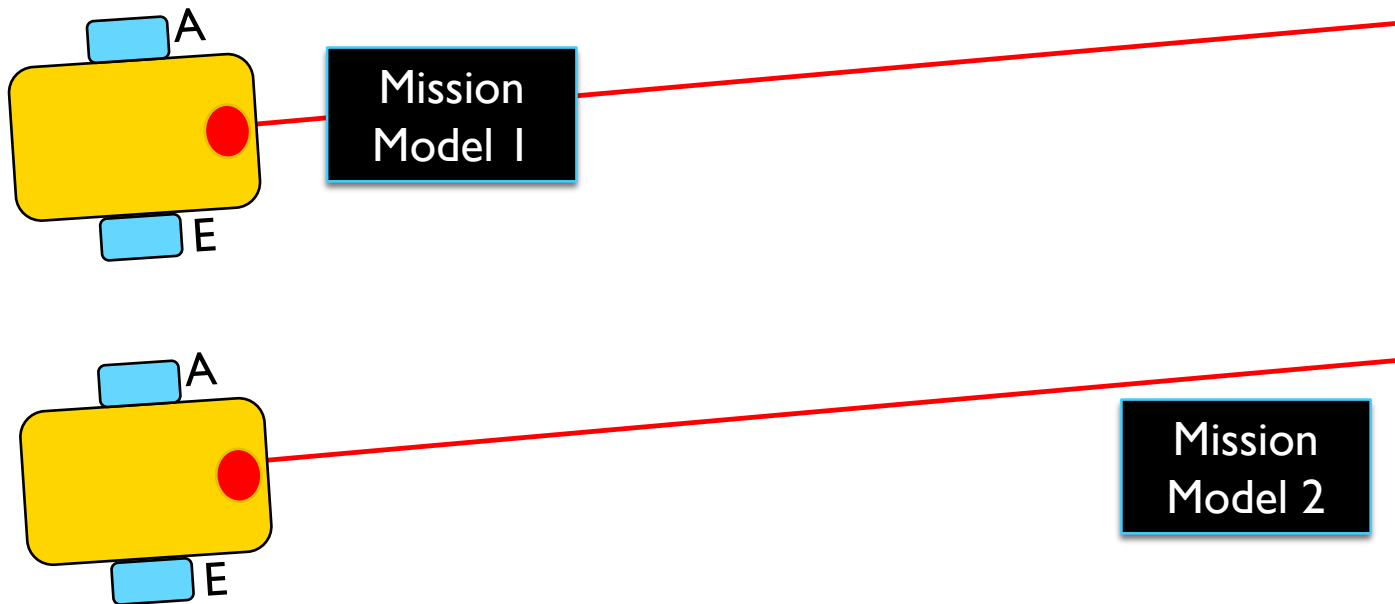

STARTING POINTS IN LAUNCH ARE CRITICAL

- In FIRST LEGO League, teams need to figure out where to start in the launch area
- **Jigs:** a LEGO ruler/wall that your robot can align against them in base (the red triangle is an example of a jig)
- **Same start each time:** pick one spot and start there no matter what the mission for easy starts
- **Grid/Radial Lines:** Use the grid lines to pick a starting spot for each run
- **Words:** Launch has a FIRST LEGO League logo. You can use letters in the logo or the border for the image to line up
- Even better...try to find a way to align the robot using other techniques (see slide 6)

ERRORS ACCUMULATE OVER TIME

- By the time you get to the far side of the table, you are no longer in the right position
- Solution: Repeat alignment techniques multiple times in a run for better reliability (see slide 7)

WHERE ARE YOU ON THE COMPETITION TABLE?

- These are common alignment strategies used:
 - **Align on walls** – deliberately back into a wall to straighten out
 - **Square/Align on lines** – If you are moving angled, you can straighten out whenever you see a line using two color sensors
 - **Move until a line** – travel until you find a line so you know where you are on the mat
 - **Align on a mission model** – Mission models that are stuck down with dual-lock can be used to align against

OTHER FACTORS IN RELIABILITY

■ Battery life

- If you program your robot when the battery life is low, it won't run the same when fully charged
 - Motors behave differently with low battery
 - But using sensors makes you not as dependent on battery

■ LEGO pieces come apart over time:

- Squeeze in LEGO pieces in key areas before a run – the pegs get loose which means the sensors may not be in the same place as a previous run
- Push wires in for sensors and motors. They come out!

■ Motors and sensors don't always match:

- Some teams test motors, sensors and wheels to make sure that they match
- You will never get a perfect match so we recommend use other techniques and accept that they will be different
